

The Role of Geography in Linguistic Change: Existential Agreement in European Spanish

Daniel Ezra Johnson, post-doctoral researcher, CRTT (Lyon 2)

PALSE project "Immigration, identité et diversité sociolinguistique
en contexte créolophone au Canada"

A Multilingual Sociolinguistic Variable

- *Il y a une vache dans mon jardin.*
- *Il y a **des vaches** dans mon jardin.*
- **Il y **ont des vaches** dans mon jardin.*

- *Hay **vacas** en mi jardín.*
- *??**Hayn vacas** en mi jardín.*
- *Había **vacas** en mi jardín.*
- *?**Habían vacas** en mi jardín.*

- *There was a cow in my yard.*
- *There **were cows** in my yard.*
- *?There was **cows** in my yard.*
- *There's **cows** in my yard.*

Why study Existential Agreement?

- A (slow) ongoing change in opposite directions.
English: rise of non-standard singular agreement.
Spanish: rise of non-standard **plural agreement**.
- Studies show different **rates** of agreement across geographical varieties, but similar **constraints** on the variation (factors favoring or disfavoring it).
- **Variationist** studies model and measure these factors, but usually don't try to explain them.
- Can we understand variation better with **cognitivist** principles, looking at the use of **constructions** and considering **meaning** in accounting for variation?
- What about regional variation within countries? Is the change spreading? If so, how? And why?

Existential Agreement in Spain

Jeroen Claes's
study (2017)

- 5500 **geocoded** tweets, 2031 tokens from *COSER* spoken corpus of rural speakers born < 1940s.
- Was able to make a **diachronic** comparison, but the comparability of the two data sets is unclear.
- Fit a **logistic mixed-effects model** to estimate the effect of Twitter vs *COSER* and other factors.
- Large effect: **verb tense, region**; smaller: **polarity**. Regions diverging over time, even as agreement spreads (?) west from Valencia and Catalonia.
- Origin of change seen as **contact with Catalan** (Valencian). The story in Catalan is complicated.
- Used GAM to map a **continuous** geographic effect.

A study of Existential Agreement on Twitter

(work with
Jeroen Claes)

- Collected tweets with *haber* or *there*. R package *streamR*, August 2016. >20 million, >2 for Spain.
- We plan to look at and compare Spain, Argentina, United States, and United Kingdom / Ireland.
- Today: Spain (except Canary Islands, Ceuta, Melilla). Spain has less plural existential agreement than some Latin American countries (Claes 2015 studied Dominican Republic, Puerto Rico and Venezuela).
- After filtering – most are *hay* – and geocoding based on the user's *location* field: 26807 tokens.
- Mapped location to 1609 *municipios* (of 8028 total). Madrid: 6207 tweets, Barcelona: 2905, 680: only 1.
- GAM model with verb tense, polarity, and their interaction (not found significant by Claes 2015), and geography (latitude/longitude of each token).

Logistic Regression

and

Generalized Additive Models

- logistic regression
- estimates prob. of plural agreement for each token (even though obs. is binary).
- log-odds of probability as linear function
 $\log(p / (1-p)) = x_0 + ax_1 + bx_2 + bx_3 \dots$
- *mgcv* R package: GAM adds smoothing splines, here for geography (lat./long.).
- 'isotropic smoothing term on the sphere'
*gam(plural ~ negation * tense +
s(latitude, longitude, bs = 'sos'))*
- Simon Wood

Linguistic Factors

Logistic Regression Model

tense : polarity	log- odds	# plural	# singular	% plural
past subjunctive : positive	+ 0.156	165	1039	13.7 %
past subjunctive : negative	+ 0.200	57	376	13.2 %
imperfect : positive	0.000	580	4362	11.7 %
imperfect : negative	− 0.364	105	1134	8.5 %
conditional : positive	− 0.235	63	572	9.9 %
conditional : negative	− 0.377	37	375	8.9 %
present subjunctive : positive	− 0.352	535	5770	8.5 %
present subjunctive : negative	− 0.359	153	1569	8.9 %
future: positive	− 0.171	609	5458	10.0 %
future: negative	− 0.847	78	1383	5.3 %
preterite : positive	− 0.990	87	1907	4.4 %
preterite : negative	− 0.893	20	373	5.1 %

Linguistic Factors

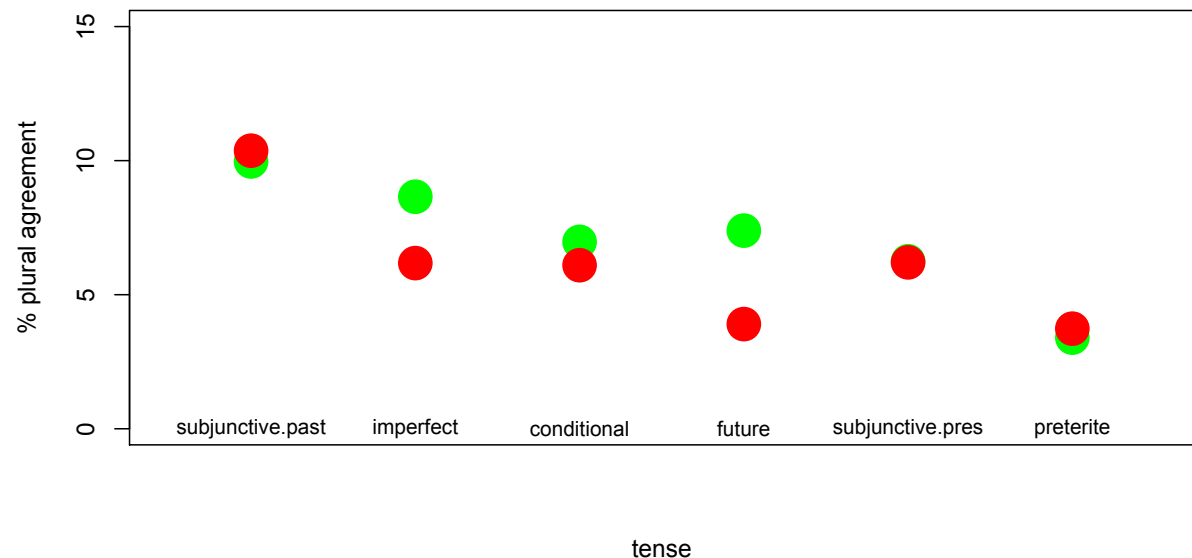

The Effects of Tense and Mood

- Fairly large effect of tense/mood (esp. preterite).
- Can largely explain it with *statistical preemption*.
- Idea is: agreement spreads from auxiliary uses (perfect tenses) where it is mandatory:
*ya lo **había** hecho , pero muchas graciassss...*
*nunca me **habían** confundido tannnnnto*
- Forms used more often in auxiliary constructions (vs. existential) show more plural agreement.

Linguistic Factors

The Effect – or Non-Effect – of Negative Polarity

- A polarity effect exists only in **imperfect, future**.
- Known: also exists in **present** (Claes, LatAm).
- Idea: in the negative, a **type** not an **instance**.
- **Subjunctive**: both positive and negative: **irrealis**.
- **Conditional**: both **hypothetical / counterfactual**.
- **Preterite**: 'subject' is always **definite** and usually **discourse-old** and/or **qualified/modified**

Posts and Retweets by Province

- collected 52 **retweets** (13-14/03/17) where I could geocode locations of both original poster and retweeter
- what provinces sent **from**?
- what provinces sent **to**?
- **all 52** were **posted** and **retweeted** in the **same province**
- Barcelona: **29**; Madrid: 7
Asturias, Balears, Vizcaya: 3
Alicante: 2; Cantabria, Girona, Lleida, Segovia, Valencia: 1 each.

Merci!
